

Section	Description
Resource Title	Enterprise Density
Resource Abstract	The ratio of secondary and tertiary sector enterprises to total population contains four kinds of information: first, it is determined by the labour force participation rate. Secondly, it is influenced by the number of people working in agriculture. The third factor reflects the degree of "centrality" of a municipality, as inhabitants relate to their place of residence, but the number of enterprises relates to the place of work. The last factor is one of size: municipalities with high values have a smaller average size of enterprises than those with low values. Such a mix of relevant impact factors makes it difficult to interpret this indicator.
Resource Type	Dataset
